NIVRA

Before impact.

AI-assisted early intervention for safer public spaces

Team Damage Control

T3 · AI for Good / Idea proposal

A camera can record. Someone still has to notice.

The gap

When a developing incident goes unnoticed, footage alone cannot bring help.

Our first users

Campus safety staff, teachers and event marshals who need a clear place and reason to respond.

One connected response

A proposed workflow using a camera, a laptop and responder phones

01 Observe

An approved phone or CCTV feed captures the scene.

02 Review

NIVRA flags a movement pattern. A person reviews the replay.

03 Respond

The operator sends a location. Staff acknowledge and act.

AI looks at movement over time

Computer vision estimates body positions. Rules combine repeated visible changes.

Distance closes

People repeatedly move closer.

Movement changes

Gestures or speed increase.

A review is requested

A human checks the context.

People make the call.

NIVRA would support attention. A trained person would decide what happens next.

Human review

Dismiss, keep watching or send help.

No identity inference

No facial recognition or guilt scores.

Limited video use

Short context buffers and restricted access.

Visible limitations

Poor light and blocked views must be flagged.

The smallest demo worth building

Two phones. One laptop. One staged interaction.

01

Connect

Stream an approved phone camera to the laptop.

02

Flag

Use pose estimates and movement rules to raise a review.

03

Decide

Show a short replay. Let the operator dismiss or dispatch.

04

Close the loop

Send an alert to phone two and record acknowledgement.

Current stage: idea. The prototype and its performance still need to be validated.

More time to respond.

The goal is earlier human attention and a clearer path from alert to help.

What we would measure

Time to human review

Time to staff acknowledgement

False alerts during ordinary activity

Missed events in staged tests

Start with one supervised campus trial

Test staged interactions and everyday movement.
Review false alerts with staff before expanding.
